

## ***AIDSinfo*: A Clinician's Resource for Comprehensive HIV/AIDS Treatment Information**

The federally approved HIV/AIDS medical practice guidelines are the primary source of information for state-of-the-art HIV care in the United States. Published by *AIDSinfo*, a service of the U.S. Department of Health and Human Services (HHS), these guidelines provide the recommended and alternative antiretroviral therapy regimens for adult, adolescent, and pediatric patients. They also cover other aspects of HIV care, including the prevention and treatment of opportunistic infections and the prevention of perinatal HIV transmission. The guidelines represent a collaborative effort, with each set developed by a panel of experts that includes health professionals, researchers, and community members. The panels meet regularly to review the latest clinical research and keep the prevention and treatment recommendations up to date.

*AIDSinfo* makes the guidelines freely available to health care providers, policy makers, and patients through our website and through a downloadable app for iOS and Android mobile devices. Website traffic to the guidelines has been steadily increasing over the past few years. In 2016, the guidelines received more than 1.3 million unique page views on *AIDSinfo*'s website, an 18% increase from 2015. In addition, users downloaded the guidelines app more than 7,800 times in 2016. As part of a website redesign in 2017, *AIDSinfo* plans to make the guidelines easier for visitors to search and navigate. The redesign, along with the continued development of our guidelines app, will help the guidelines reach more clinicians and patients in the future.
