

I really enjoyed being exposed to both inpatient and outpatient management.

**There's just no replacement for one-on-one time with an experienced provider where you can ask questions about clinical care. And now I have a broader network of experienced providers I can continue to reach out to and ask questions of. I also saw the multidisciplinary services that the site had available, and I saw the importance of advocating for more of these services in my clinic.**

- Physician

**The preceptorship was valuable to me as a non-ID-trained physician.**

Today we see more and more that primary care clinicians are being encouraged to provide HIV as well as primary care to their HIV-infected clients.

**An opportunity like this preceptorship offers primary care clinicians a valuable experience and insights into how we can effectively provide both primary care and HIV-management for our patients.**

- Physician

**It was a great experience.** My preceptor has so much knowledge. For me specifically, even though my prior training was in the same city, the setting, patient population and clinical practice patterns were different. **This experience therefore gave me greater insight into how different clinicians practice.**

- Pharmacist

**The preceptorship was a very valuable experience. It was nice to compare my practices to those of a leader in HIV care.**

- Nurse Practitioner

**I found this to be a very valuable experience. As a fellow who has worked primarily in one city, it showed me another model of care. The demographics of the patients I saw during the preceptorship were also different from the patients I currently see.** These demographics bring with them different social issues that I don't typically deal with. At the same time, the clinical parts of the preceptorship offered a good reinforcement of the principals of HIV care that I learned during my fellowship.
